Chronos — Results and Testing Report

Submission evidence based on the repository implementation

Automated test coverage

The repository includes a Python smoke test that starts the native C service, verifies the dashboard assets and API, tests alarm creation/toggling/deletion, verifies a weekday-recurring alarm fires and remains recurring, tests snooze behaviour, restarts the service to verify persistence, and deletes a history entry.

Test area	What is verified
Build	Native C service builds through the Makefile.
Web UI	HTML, CSS and JavaScript assets are served by the C service.
API	State retrieval and alarm create/toggle/delete endpoints respond correctly.
Alarm scheduling	Forked scheduler triggers a future alarm.
Recurring alarms	Weekday recurrence is stored, fired and rescheduled.
Snooze	A fired alarm can be snoozed for approximately five minutes.
Persistence	Alarm and history state survive a service restart.
History	Fired alarms are recorded and individual history entries can be deleted.

Required screenshots for the final GitHub submission

Capture these from the actual running project rather than using fabricated images:

1. Dashboard home / live clock
2. New alarm dialog and an alarm listed in the dashboard
3. Recurring weekday alarm configuration
4. Alarm firing with the dashboard notification/sound controls
5. Alarm history
6. Timer and stopwatch
7. World clock / time-zone view
8. Ubuntu terminal showing the service and scheduler PID
9. Terminal showing make test passing

Evidence note

This report describes capabilities present in the repository. A screenshot should only be labelled as a result after the corresponding feature has been run locally.
